MEASURING YOUR WINDOWS

Tintplus pre-cuts all window film to make installation easier and quicker for the installers. We add 20mm to the actual height and width measurements that you enter in the WebQuote and these measurements are sent to our computer cutter to cut the film. This eliminates human error in film cutting. However, **you do have to ensure that your measurements are accurate to within 5mm**.

Print our Worksheet and use it to record the window measurements.

How to Measure for Window Film?

Measure each window pane to be tinted and record on the Worksheet the height and width of each pane in millimetres. Then record the number of panes that size (You do not need to add 20mm for custom fitting – we do that).

- **DO NOT ASSUME THE FIXED PANE AND THE SLIDING WINDOW PANE ARE THE SAME SIZE** – the fixed pane is often a bit larger - **MEASURE EACH PANE TO MAKE SURE**.

When you have recorded all your window measurements on the Worksheet, you can then enter the measurements in our WebQuote and calculate the cost.

Please note: Tintplus is not responsible for any errors that result from inaccurate measuring of windows or due to errors in entering the measurements into the WebQuote.

- If you do not feel confident that you can accurately measure your windows and enter those measurements into the WebQuote, please phone 1300 658 503 and book an appointment with a sales rep.

ALL MEASUREMENTS ARE TO BE ENTERED IN MILLIMETERS.

TINTPLUS WORKSHEET

Room	Height (mm)	Width (mm)	Number
Example – Bedroom	1125	865	2
